

EXDON 04.10.2024

Identify the possible Entities, their Attributes and the relationships between the entities from each of the following given scenarios. Construct your ERD following diagramming convention. Write the sentences for each relationship, in both directions.

1. The management of an airport has decided that all information related to the airport's activity will be managed using a database. Each aircraft has a registration number and a model. The airport has some aircraft models, and each model is identified by a code (eg DC-10) and has a certain capacity and weight. At the airport work many technicians. About them, we must know the name, id, address, telephone number and the salary. Each technician is an expert on some aircraft models. Traffic controllers must have thorough medical control. For each traffic controller, we must know the date of the latest medical check. The employees of the company (including the technicians) could be members of one of the existing unions. For each union member, we must know the name of the union of which he is a member, the date on which he registered and the number of the card. Several tests apply to airplanes to check their technical status and to issue the flight authorization for that aircraft. Each test is identified by a code, a name and the maximum possible score and the minimum score necessary for the flight authorization to be issued are known. It is necessary to memorize the date when a particular test was applied to an aircraft, the score obtained, and it is necessary to know who the technician is who took care of the application of that test and how long the test lasted.
2. **BOOK.COM** is an online store on the Internet where customers can browse the catalog and select products of interest. Every book has a title, ISBN, year and price. The store also keeps the author and publisher for any book. For authors, the database keeps the name, address and the URL of their homepage. For publishers, the database keeps the name, address, phone number and the URL of their website. The store has several warehouses, each of which has a code, address and phone number. The warehouse stocks several books. A book may be stocked at multiple warehouses. The bookstore keeps the name, address, email-id, and phone number of its customers. A customer owns several shopping carts. A shopping cart is identified by a Shopping_Cart_ID and contains several books. More information will be needed to complete the transaction.

Usually, the customer will be asked to fill or select a billing address, a shipping address, a shipping option, and payment information such as credit card number.
