

NORMALIZATION

1. For a table to be in the **First Normal Form**, it should follow the following 4 rules:

- It should only have single(atomic) valued attributes/columns.
- Values stored in a column should be of the same domain
- All the columns in a table should have unique names.
- The order in which data is stored, does not matter.

2. For a table to be in the **Second Normal Form**:

- It should be in the First Normal form.
- It should not have Partial Dependency

3. A table is said to be in the Third Normal Form when:

- It is in the Second Normal form.
- It doesn't have Transitive Dependency (A transitive dependency exists when any attribute in an entity is dependent on any other non-UID attribute in that entity)
